Instructions for Adaptic Touch Non-Adhering Silicone Dressing

Dressing Selection:

- Select a size of Adaptic Touch that is larger than the wound to ensure dressing can be applied to intact skin surrounding the wound margins.
- Adaptic Touch can be cut to size and the dressing will not unravel or shed fibers.
- If more than one piece of Adaptic Touch is required, ensure dressings overlap to avoid secondary dressing adherence to the wound; however, overlap should be minimized to prevent occlusion of holes.

Dressing Application:

- Prepare the wound according to wound management protocol
- Ensure skin surrounding the wound is dry
- Remove protective films from dressing
- Place Adaptic Touch dressing directly over the wound and smooth in place around the wound
- Cover with an appropriate semi-occlusive secondary dressing, e.g. Tielle Hydropolymer Dressing

Dressing Change: Adaptic Touch may be left in place for several days depending on wound condition and exudate level.
